

HERITAGE FROM ATLANTIS

THE QUALITY OF MOUNTAIN CRYSTALS

Our mountain crystals contain cracks, fissures and opacities. Why don't we offer totally clear crystals?

Most of the naturally grown crystals contain opacities, "cracks" or "jumps". In case there are cracks formed during the crystallization process caused for instance by tectonic changes, liquids can penetrate into these cracks. This way other crystals, dendrites, etc. can be deposited there. Over time these cracks are being healed, therefore these foreign particles (or gas or fluids) are encapsulated.

In summary, the following applies:

We don't want to and are not supposed to offer "crystal clear" mountain crystals (this happens only very exceptionally). We offer the kind of quality of crystals that was clearly recommended by the spiritual world and our stone merchant was very pleased with this choice as well. Even for professionals it is very difficult to distinguish a flawless mountain crystal from a synthetic one. Therefore, inclusions, opacities, etc. are very welcome.

They ensure that we deal with real naturally grown mountain crystals, so each crystal is unique. In case you are unable to emotionally engage with your crystal, please let us know, exchange is possible.

Why do the crystal or the engraving have small spalls?

Small spalls are inevitable during the cutting and engraving of crystals to the thickness of 0.5 cm and 2 cm. To sort out these crystals would lead to a very, very high waste, which neither we nor our spiritual guides consider appropriate. The effect of the crystal is not adversely affected by these small "imperfections". In case your crystal has major deficiencies, please let us know, an exchange is possible.
